## **Credit Card Approvals**

## Background

Commercial banks receive a lot of applications for credit cards. Many of them get rejected for many reasons, like high loan balances, low income levels, or too many inquiries on an individual's credit report, for example. Manually analyzing these applications is mundane, error-prone, and time-consuming.

You will build an automatic credit card approval predictor using machine learning techniques. The data shows the credit card applications a bank receives. The last column in the dataset is the target value.

## Instructions

Use supervised learning techniques to automate the credit card approval process for banks.

Preprocess the data and apply supervised learning techniques to find the best model and parameters for the job. Save the accuracy score from your best model as a numeric variable, best\_score. Aim for an accuracy score of at least 0.75. The target variable is the last column of the DataFrame.

```
import necessary libraries
import pandas as pd
import numpy as np
from sklearn.model_selection import train_test_split
from sklearn.preprocessing import StandardScaler
from sklearn.linear_model import LogisticRegression
from sklearn.metrics import confusion_matrix
from sklearn.model_selection import GridSearchCV

# Load the dataset
cc_apps = pd.read_csv("../data_raw/creditcard_approvals.data", header=None)
cc_apps
```
